

# PARTNERme

Person-Centered Network Tool

## We Know That Social Connectedness is a Determinant of our Health and Well-Being

However it's difficult for helping professionals like doctors to integrate measures of social connectedness into patient care. PARTNERme, a person-centered network tool, is our solution: An easy-to-use tool for identifying & filling gaps in patient social support networks, link patients to resources, improve health outcomes, and reduce overall system costs.

What takes place in the formal healthcare system only affects 15% of the outcomes for an individual and their family. The other 85% is attributed to our social determinants of health (SDOH), which include the social and economic barriers that people experience such as housing issues, food insecurity, transportation and mobility challenges, and access to economic opportunities.

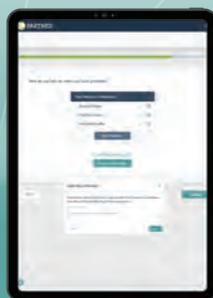

Yet, providers do not have practice-level interventions, community-based interventions or partnerships, relevant resources or tools to address adverse social connectedness at the point of care.

## How Does PARTNERme Work?

The tool is versatile, for use in a clinical setting or in the comfort of the patient's home. You can take the PARTNERme screening on a tablet or phone in less than 5 minutes, using these four steps.

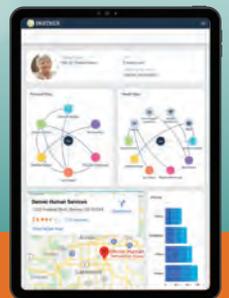

First, the Tool screens the patient to understand their social needs & other factors.

Second, the Tool asks who helps with each need to identify gaps.

Third, the Tool identifies the most pressing need with the least amount of social support

Fourth, the Tool provides targeted referrals & data for care coordination.

## What Are the Benefits?

Measuring social connectedness is critically important for effectively improving the social determinants of health for patients and those we serve, however the benefits of PARTNERme are greater than that alone...

### Individual Health Outcomes

When patients receive multiple social referrals for needs they already get help with from family and friends, they're less likely to follow up in the key areas where they don't have assistance. With information on their support networks we can better identify gaps to provide targeted referrals that actually help.

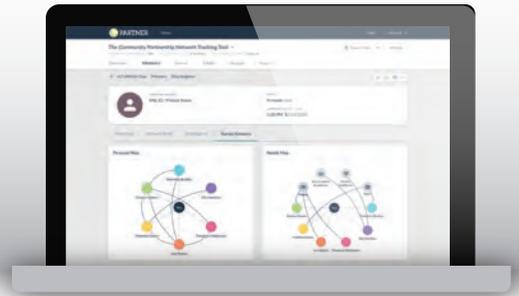

### Ecosystem Level Outcomes

As a feature of PARTNER, individual-level network information can be integrated with organizational network data. This provides opportunities for multi-level network analysis that connects organizational network processes with individual level

## Learning Lab

Make sense of your data.

We provide numerous training opportunities for virtual peer-learning, webinars, online courses and more in our Learning Lab. This is a great space for network practitioners to learn how to build, manage & evaluate networks for social impact.

## Better With Our CPRM

PARTNERme is a feature of the PARTNER Community Partner Relationship Management System (CPRM). When you fully integrate the PARTNERme with the PARTNER CPRM, your insight grows exponentially to provide a whole network understanding of complex personal support systems and referral networks.

### Everything You Need to Create Whole Networks of Care Plans

With methods to visualize networks & identify levels of trust & dependency, coupled with system levels data, you can create plans to support a patient's whole person and guide them to needed support.

## Consulting Services

Get professional help on a custom project

We work closely with health and public health systems to develop network data tracking and learning systems. We make social support & resource networks visible, using data-informed network science approaches. Our team of network scientists brings together experience in social network analysis, building tools & technology, and translating data to practice. Contact our team to see how we can provide consulting for your needs.
